

Replicator

Source Database

Target Database

1. Get unique ID from Source DB

2. Get the last source sequence ID from Target Database

3. Fetch `_changes` after last source
sequence ID

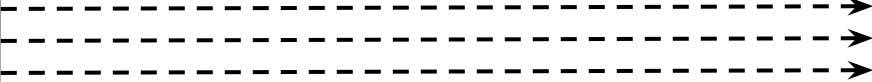

4. Send doc/rev pairs from `_changes` to `_revs_diff`

Result contains the subset of revisions not in Target db

5. Get each rev in set returned in previous step

6. Store the group of revisions

7. Update the last source sequence ID (checkpoint)
